# New hook:
# ‘useOptimistic’

# REACT 19

coming soon...

# Purpose

The useOptimistic hook enhances user experience by enabling immediate UI updates based on anticipated results, even before the server confirms the action.

This creates the illusion of a faster and more responsive application.

swipe for code

# How it works

1. User Initiates Action: A user interaction triggers an action, such as submitting a form or clicking a button.

2. Optimistic State Creation: The `useOptimistic` hook takes the current state as input and returns an object containing two key parts:

   - `optimisticValue`: This represents the anticipated state after the action is successful.
   - `updateOptimistic`: This function allows you to update the optimisticValue based on user input or other factors.

3. UI Update with Optimistic State: The UI component utilizes the optimisticValue to reflect the expected change on the screen.

4. Background Operation Runs: In the background, the actual operation (e.g., sending data to the server) is carried out.

5. Outcome Handling:

   - Success: Upon successful completion, the optimistic state becomes the permanent state, and the UI remains consistent.
   - Failure: If the operation fails, the UI is reverted to its original state, potentially displaying an error message.

Swipe for code

1

```
const { optimisticValue, updateOptimistic } = useOptimistic(count);

const handleClick = () => {
  updateOptimistic(count + 1);
```

2 UI updated 3

send data to server 4

```
  fetch('/update-count', { method: 'POST', body: JSON.stringify({
count: count + 1 }) })
    .then(() => console.log('Count updated successfully'))
    .catch(() => console.error('Failed to update count'));
};

return (
  <div>
    <p>Count: {optimisticValue}</p>
    <button onClick={handleClick}>Increment</button>
  </div>
);
```

# Real life Applications

**E-commerce Shopping Carts**: Update cart totals immediately after adding or removing items, providing a smooth shopping experience.

**Messaging Applications**: Display messages as "sent" right away, even before server confirmation, enhancing the feeling of real-time chat interaction.

**Social Media Likes**: Show a like animation and update the like count instantly upon clicking the "Like" button, creating a more engaging user experience.
